

FDM Nylon-CF10

Carbon Fiber Filled FDM Thermoplastic Filament

The information presented are typical values intended for reference and comparison purposes only. They should not be used for design specifications or quality control purposes.

Overview

FDM® Nylon-CF10 is a composite material combining a blended nylon polymer with 10% chopped carbon fiber (by weight), enhancing the material's strength and rigidity. The nylon base polymer also gives FDM Nylon-CF10 good chemical resistance.

Mechanical Properties

FDM Nylon-CF10 samples were printed with a 0.010 in. (0.254 mm) layer height.

Print Orientation

Parts created using FDM are anisotropic as a result of the printing process. Below is a reference of the different orientations used to characterize the material.

Tensile Curves

Due to the anisotropic nature of FDM, tensile curves look different depending on orientation. To the left is a guide of the two types of curves seen when printing tensile samples and what reported values mean.

A = Tensile at break, elongation at break (no yield point)

B = Tensile at yield, elongation at yield

C = Tensile at break, elongation at break
